

***mJobTime™* — A Flexible, Easy To Use Wireless Timekeeping Solution Designed For Companies With More Than Basic Timekeeping Needs**

m *JobTime™* is an enterprise level wireless time tracking software solution for the construction industry that requires minimal manual entry, runs on a wide range of devices, interfaces with most popular accounting systems and is designed to grow with a company's needs. "Payroll is the largest expense at construction companies," says Richard Daniels, CFO of *mJobTime* Corporation. "Automating and streamlining businesses processes is the

best way to rein in payroll expense, improve efficiency and increase operational control."

Time tracking is the best place to start, according to Daniels. Tracking and controlling time leads to immediate and tangible gains in productivity and cost reductions by eliminating hand written time records and manual input.

"*mJobTime* is built on a fast, secure, scalable SQL database," Daniels points out. "This enables project managers and field foremen to collect employee time, daily field

"With this technology in place, mJobTime customers will not outgrow their time tracking system."

reports and equipment usage in real time, or input later."

mJobTime is GPS-enabled and tracks labor and equipment time by job, phase and cost code, and allows field personnel to log important job site events such as productivity, deliveries, accidents, delays and meetings.

Uncluttered straightforward screens, built-in defaults and an optional Spanish language interface make *mJobTime* easy to learn and use by field and administrative personnel. Even employees with limited technical expertise will find the default options and clearly labeled text boxes helpful and simple to navigate.

mJobTime uses SQL Anywhere technology from Sybase for data management and transfers to and from the field. "With this technology in place," says Daniels, "*mJobTime* customers will not outgrow their time tracking system."

According to the company, *mJobTime* provides a high level of security without inconveniencing users. Data is protected from unauthorized access by network security and database security, and data can be saved with regularly scheduled back-ups.

"The ability to securely transfer information both to and from the field helps separate *mJobTime* from the competition," Daniels explains.

"With *mJobTime's* two-way synchronization, the potential for human error is virtually eliminated, providing data that is accurate and reliable. New employee and job data can be sent to the field as soon as it is entered in the accounting system, and foremen can send time records from the field daily, greatly reducing the traditional payday logjam." *mJobTime* runs in the field without a constant Internet connection. A connection is required only during the synchronization process.

Companies that require employee signatures on time cards will love *mJobTime's* digital employee signature capture. Accountability is built-in with approvals at multiple levels and an explicit audit trail for any time records that have been modified, indicating the changes, who made them and when.

Getting started is straightforward and easy, says Daniels. "We prepare users to get the maximum benefit from their *mJobTime* system by providing well-planned, customized on-site implementation and training for both field and office personnel. If your company has more than basic timekeeping needs, you'll quickly discover that *mJobTime's* features, functionality and flexibility can result in immediate improvements in field force time management."
